Abstract

Stanislav Južnič: Hallerstein and Chinese Karst

The life and work of the Carniolan scientist Auguštin Hallerstein was described. Hallerstein’s maps of the Chinese karst areas were discussed. The data about his travels through the karst regions were presented.

Key words: Hallerstein, Jesuits, Carniola, China, karst, maps.

INTRODUCTION

On August 28, 2003, three centuries passed from the birth of Avguštin Hallerstein (1703-1774) in Ljubljana. He finished his lower and upper studies at the Jesuit college Ljubljana and competed his mathematical learning in Vienna and in Portugal. Hallerstein’s abilities in geometry were developed in collaboration with the Viennese rector Johann Baptist Thullner, (1668-1747), former professor of mathematics in Ljubljana. Thullner’s Geometry of 1711 was one of the best Jesuit works ever published.

Hallerstein was among the first Europeans to draw the maps of the Chinese karst regions. On January 21, 2003, the post of Slovenia issued the stamp to honor the 300th anniversary of Hallerstein’s birth. On August 28, 2003, the memorial tablet was unveiled at Hallerstein’s family castle in Mengeš.

NORTH OF THE GREAT WALL

The mapmaking was the Jesuit fashion of Hallerstein’s time. Mattheo Ricci (1552-1610) draw the first map of China for Europeans. Xu Xiake (1587-1641) posthumously published the very first systematic research of the Chinese Karst in 1642 (Ravbar 2003, 249).

Martin Martini (1614-1661) published the collection of the China maps in 1655. He described the famous iron chain bridge An-Lan over the karst river in the province of Guizhou. In his time, the province was called Kouei-tcheou and Koey-tscheou (Hallerstein 1780, 292, 378).

Athanasius Kircher (1601-1680) republished Martini’s description and other letters of the Chinese missionaries. In the fourth part of his book Kircher described the Chinese mountains, waters, vegetables, mammals, birds, fishes, snakes, stones, and minerals. Among Kircher’s collaborators was the Chinese missionary Johann Gruber (1623-1680) who traveled for three years before he returned to Rome in 1664.

Between 1689 and 1698, the astronomer and geographer Jean François Gerbillon (1654-1717) accompanied the Chinese emperor to Tatary for eight times. In 1692, he finished the map of the Great Tatary in the northern China. On emperor’s order, Joachim Bouvet (1656-1730) and Jean Baptiste Régis mapped the Great Wall. In June 1708, the Jesuits Pierre Jartoux (1669-1720), Ehrenwert Xaver Fridelli (1673-1739), Cardoso, de Tartre, Joseph Marie Anne de Moyriac de Mailla (1669-1748), Roman Hinderer, Régis, and the augustinian Bonjour began to draw the maps of the lands near the border of Korea. For seven years, Fridelli traveled through the empire and issued the map of the whole empire with Mongolia and Manchuria up to the Russian border. The Jesuit Jean Baptiste Du Halde (1674-1743) published the Jesuit maps of China compiled by the best geographer of his time Jean Baptiste Bourguignon d’Anville (1687-1782). D’Anville’s redaction became the foundation of the modern maps of China.

Hallerstein continued the mapping of China. In 1738, he draw his first map of Macao. In 1748, Hallerstein and his assistant Felix de Rocha (1713-1781) made the relief map of the province of Mu-lan, today Mulan Paddock on the north side of the easternmost end of the Great Wall in Hebei province. Mulan Weichang was build already in 1681. Nine years later, the emperor defeated the Mongol rebels at a battlefield situated just 15 km south of Mulan Hunting Ground.

The emperor hunted in Mu-lan every third autumn and urgently needed the accurate map with the description of his chase. At the hinting time, the emperor stayed for three or even five months in those places beyond the Great Wall. The Chengde Mountain Resort of Hebei Province used to
be the largest summer resort of the Qing Dynasty.

In 1749, Hallerstein and his collaborators carried on the topographic and horographic mapping of Mu-lan, the Tatar land on the northern side of the Great Wall. Besides mapping in modern sense of the world they described the waters, climate, soil, vegetable, and animal world of the area. In between, Rocha performed some astronomical observations. Hallerstein described the uninhabited lands called Har-zin and Oguiot to his brother Baron Vajkard Hallerstein (1706-1780) in Brussels. All area was one continued chain and labyrinth of mountains and valleys, without inhabitants, but full of wild animals, as red deer, wild boars, bears, and tigers. The soldiers guarded all passages of the valleys, and nobody was allowed to pass through them (Pray 1781, 28; Hallerstein 1753, 322).

Rocha and Hallerstein mapped the area one degree wide and one degree long between 41.5° and 42.5° of north latitude. On the west, they reached the meridian of Beijing. The Chinese used that meridian as the first one for geography and astronomy. They mapped the north part of the modern province of Hebei with the characteristic karst of the moderate warm, half dry climate. They marked the most suitable hinting areas. The emperor was very pleased. Upon Hallerstein’s return the emperor gave him a most gracious reception, and asked many questions concerning the mapped country. At the same time, Hallerstein’s Italian friend Giuseppe Castiglione (1687-1766) painted his famous Mulan Hunt.

Hallerstein was the first Carniolan researcher of the Chinese karst. On November 28, 1749, he reported about his observation of Mu-lan karst to his brother Vajkard. On September 18, 1750, he sent the similar, somewhat longer description to Mortimer of the Royal Society. Hallerstein was not able to send them the copies of the maps jet, because the drawing was not accurate enough. Later, his horographical maps were published in Chinese language in Beijing on 120 pages (Bernard 1960, 379). In April 1755, his French friend Antoine Gaubil (1689-1759) sent to the Royal Society several maps of the Chinese lands, probably with Hallerstein’s map included (Šmitek 1995, 113).

The northwest corner of Hallerstein’s map was on the border of the modern Inner Mongolia (Nei Monggol) near the town Doulun. On the northeast, Hallerstein mapped the area up to the modern province of Liaoning well known for its oil slates that extends up to the Korean border to the east. Hallerstein’s map was a square with a side four foot long. Therefore he used the approximate ratio 1 : 90.000. In 1744, Ivan Dizma Florjančič de Grienfeld (1691-after 1757) published the comparable map of Hallerstein’s native Carniola in the approximate ratio 1 : 111.000.

Mu-lan in the Hebei Province should not be confused with over ten degrees southern Mulan in the northern part of the County Huangpi near the suburbs of the town Wuhan in Hubei Province, the home of the legendary Chinese girl warrior Mu-lan. Hallerstein’s Mu-lan is today preserved as one of the few natural grassland resorts. A part of Mulan Hunting Ground is included in Saihanba National Forest Park with forest covering over three quarters of all area. The park entertains eighty-one families of higher plants, eleven families of animals and twenty-seven families of birds.

The modern Hebei Province has three geological parks: the Baishi (White Stone) Mountain in Laiyuan, Liujiang of Qinhuangdao, and Tiansheng (Heaven-made) Bridge of Fuping. On north, the White Stone covers 60 square km with the only marble rock forest, ten water falls (Shipu), and Juma River. The Liujiang Park is situated 280 km away from Beijing and covers 186 square km with the mysterious Xuanyang cave. In that area the Chinese began conducting their first geological survey after Hallerstein’s mapping. The Heaven-made Bridge is located about 25 km west of Fuping and covers an area of 32 square km. The bridge sits above the 112-meter high waterfall, which is formed by metamorphic rock.
Hallerstein also knew very well the karst region between south of Beijing very well. He traveled through it after his arrival and four more times later on the diplomatic duty.

In 1752, the emperor ordered the local authorities to help Hallerstein’s land transport and river navigation. He had many delays because of the huge suite. On August 15, 1752, the Portuguese ambassador Francisco Xavier Pacheco Lampayo arrived to Macao with the presents for the emperor. He replaced the former ambassador Metéllo de Souza, who was took the duty in 1727. The suite numbered 71 people and they traveled to Beijing for four months. Hallerstein’s journeys with smaller groups were certainly much faster. The travelers had troubles with the ground obstacles, high prices, accidents and illness on the numerous meanders they had to travel through. The four successive trips took away all Hallerstein’s powers and he had to rest for few months. After his return to Beijing his friend was curious, how he suddenly grew so old. He traversed 5000 km in a year, and he found the old fashioned Chinese ceremonies especially tiresome.

Most of the time he journeyed through the karst regions. On December 25, 1752, Hallerstein, Tatar mandarin Shu, and diplomats arrived from Macao to Canton. On April 20, 1753 they arrived to Chi-Hoa. Not far north from Macao he traveled through the tropic and subtropic karst in the provinces of Hunan and Hubei, described by Xu Xiake more than hundred years before. Hallerstein and his companions continued north through the karst of the moderate warm half dry climate in the provinces of Henan and Hebei (Ravbar 2002, 191-192). They returned from the Beijing back to Macao in the company of the mandarin Hay

In October, Hallerstein finished his diplomatic mission. On October 21, 1753, he described the travel events to his brother. He mailed the letter from the camp between Im-te-hien and Hao-chen-sub in Guangdong Province, which he called Quan-tum (Pray 1781, 30-31).

In March 1756, Rocha, José d’Espinha (1722-1788), Ho Kuo Tsung († 1766), and Ming’antu (1712-1764) mapped the recently conquered northwest land of Xinjiang Uygur (Sinkiang). In 1761, Hallerstein and Benoist repaired the maps and gave them as the birthday present to the emperor Qianlong (Semans 1987, 180-181). Hallerstein’s maps were later included in the China map in the ratio 1 : 1,500,000 (Needham & Ling 1959, 3: 586).

At advanced age, Hallersten was not very willing to travel to the remote lands any more. But he was still very active geographer. He measured the distance between meridians of Beijing and Petersburg and presented to the Europeans the very first accurate census and yearly increment of the Chinese.

Fig. 2: Hallerstein’s letter to the secretary of the Royal Society Cromwell Mortimer († 1752) mailed on September 19, 1750 with the description of his mapping of the karst region in 1749 on page 2 (The Archive of the Royal Society of London).

Fig. 3: December 19, 1751 protocol of the Royal Society meeting with notes on the reading Hallerstein’s letter about the mapping of the Mu-lan, page 11 (The Archive of the Royal Society of London).
CONCLUSION

The Jesuits were very skilled in mapping. Hallerstein probably followed the example of his uncle Inocenc Volbenk Anton Franc Erberg (1694-1766) who mapped Paraguay in 1727. Hallerstein was the most famous among the early visitors of the Chinese karst. He had the opportunity to compare the Far East karst with the domestic one he admired during his September 1735 travel to Trieste, when he saw Carniola for the very last time. He preceded the contemporary Slovene researchers of the Chinese karst.
